Notes: Average velocity readings were recorded by firing four five-shot strings over a Competition Electronics Pro Chrono. The muzzle was 10 feet from the first skyscreen. Ambient temperature: 88 degrees. Elevation: 815 feet above sea level. ● The accuracy figures are the average of four five-shot groups. For accuracy, we fired the test gun from a benchrest at a 25-yard target outdoors. ● The retained-weight column shows the measured recovered bullet weight, then the retained weight as a percentage of the original bullet weight. Penetration and expansion results are the average of two to three bullets fired and recovered from water jugs. ● To calculate IPSC power factor (pf), take the bullet weight in grains, multiply it by the velocity in fps, then divide by 1000.
